

Paper Title:

Handwritten and Printed Bengali Script Word Segmentation Using Structural Analysis

Comment:

1. Reference sequence should be maintained, could not find reference 5 and 6 in the Article
2. Mention of the references' in the article was such that those works were excellent, and no problem or shortcoming was found. Aim of reading related previous works is to determining research motivation and research goals, ushered from those shortcomings and flaws in the previous works.
3. The OCR system that the authors proposed to use is not their own development; rather it looked like a commercial product.
4. The authors should avoid using the terms like 'we', 'our', and 'us'.
5. The author of the article has mentioned that their aim was to "focused on the segmentation process which is the backbone of the recognition phase." They have also mentioned "presence of many ambiguous handwritten characters and excessively swigs Bangla handwriting." Accordingly, the article should have used handwritten Bengali characters for recognition. Unfortunately, nothing like that was found in the article.
6. The key work HPP and VPP were not explained, and their working procedure was not made clear.
7. Section 4 was not clear as the results drawn was not compared with any of the previous works mentioned in the section 2. If someone has to determine the visual effect of all those experimental works by seeing by herself, I think no programming is required. Laymen eyes can recognize all those things.
8. I suggest that the authors clearly state what are their experimental outcome. The authors may consider writing few more lines, and add few more table and diagram regarding their claims.
9. The authors should follow the journal's standard in writing the sections, and the references. If there is no such format, they should consult IEEE format.
